

## ABSTRACT

An accumulator (ACC) in which a container main body(1) and a closure member (5) are screw-joined together. A reverse-butress internal thread or an internal thread having an included angle of 90 degrees is used as an internal thread of the screw-joined portion. The reverse-butress internal thread is formed in such a way that the inclination angle ( $\beta$ ) of a clearance flank of the buttress internal thread is the inclination angle ( $\beta$ ) of a reverse pressure flank (20A) receiving a load, the inclination angle ( $\theta$ ) of a pressure flank is the inclination angle ( $\theta$ ) of a reverse clearance flank (2B). The internal thread having an included angle of 90 degrees is formed in such a way that inclination angles( $\alpha$ ),( $\gamma$ ) of both flanks are equal and the included angle ( $\delta$ ) is about 90 degrees.
